

## SELF CONTAINED & MOBILE INCINERATORS

Today sure offer a versatile range of containerised and mobile incinerators to enable the incinerator to both access remote sites and to relocate with temporary work camps.

### Skid Mounting

To enable the incinerator to be uplifted and transported, the plant and its ancillary equipment such as chimney sections are mounted on to a heavy steel platform with lifting points.

Utilised on oil exploration pipelines and work camps, the skid enables the unit to relocate with the labour force.

### Trailer Mounted

To facilitate immediate access to remote locations, such as farms, or disaster areas, the incinerator is constructed together with a generator and fuel tank on to a flat bed

trailer. The incinerator also incorporates a hinged chimney to enable it to lie horizontal during transportation.

### Containerised

This option incorporates the incineration facility permanently mounted within a standard modified ISO 20' or 40' container, enabling the incinerator to be delivered fully assembled for immediate use.

The containers incorporate lighting, ventilation, fire extinguishers etc, negating

the need for a specific building or weather protection.

This arrangement of unit has been supplied to work camps, military bases, remote airports, polar bases and isolated islands.
